

MoralTrade.org Site Audit and Improvement Report

Executive Summary

Moral Trade's strongest asset is not polish; it is intellectual honesty. Across the homepage and core explanatory pages, the site repeatedly makes its boundaries explicit: it is a pilot, not a liquid marketplace; it does not provide escrow, custody, legal advice, tax advice, or hidden automation; and it separates worked examples from live proposals. That level of disclosure is unusually strong for an early-stage nonprofit or mission platform and should be preserved as a core brand advantage. ¹

The main problem is not mission credibility. It is comprehension and conversion. The site asks new visitors to absorb a lot of specialized concepts very quickly: "baseline confidence," "externality review," "moral public goods," "deferred paid offers," "proof artifacts," "priority correction fund," and "operator console" appear across public pages. The homepage does attempt intent-based routing, but the platform still reads more like a research prototype or governance spec than a donor- or participant-friendly nonprofit site. That will limit signups, referrals, media comprehension, and donor action. ²

Trust is both a strength and a weakness. The site is transparent about being early: pilot status shows **0 live proposals, 8 worked examples, 2 public profiles, and 0 completed agreements**, while the About page explicitly says governance is still forming and that named reviewer and advisor roles should become public later. That honesty is good. But for a new visitor, especially a donor or potential partner, it also means there is currently limited proof of real-world traction, limited visible team identity, and thin social proof. ³

The donation funnel is the weakest operational path. Moral Trade sends donors off-site to Every.org, then asks them to return and "log the gift afterward" if they want it reflected in platform history or governance. In parallel, the Public Goods Fund still uses manual evidence submission and states that integrated checkout is planned but not active. That creates avoidable friction, cognitive load, and uncertainty about what the "real" action is. ⁴

From a technical and discoverability standpoint, there are some positives: key pages have distinct page titles, public pages appear indexed in search, and the site uses visible H1/H2 structures and skip links. However, several items the user requested to prioritize were **not accessible** in this audit environment: Google PageSpeed Insights/Lighthouse run outputs for the specific URLs, WAVE page-level diagnostics, `robots.txt`, `sitemap.xml`, structured-data validation output, security-header scans, and an automated broken-link crawl. Because of that, content/IA/trust conclusions in this report are **high-confidence**, while performance/security/SEO implementation conclusions are **medium- to low-confidence** and flagged accordingly. ⁵

The highest-value next steps are straightforward: simplify the message hierarchy, create a conventional **Projects** hub, publish named operators/team/governance details, reduce donation-funnel friction, create a real updates/news archive, and install basic SEO/performance/security instrumentation so future decisions

are measured rather than inferred. Those changes would do more for credibility and conversion over the next year than adding more conceptual surface area. ⁶

Scope and Method

This audit reviewed the publicly accessible homepage and key public pages for **About**, **How it Works**, **donation**, **contact**, pilot updates/news, public-goods/projects analogues, trust/safety, privacy, methodology, public profiles, and worked examples. No backend, authenticated workspace, CMS, analytics account, or Search Console access was available. All findings are based on public pages and official documentation from Google, W3C, OWASP, and benchmark sites. ⁷

A few requested diagnostics were **not accessible**. Specifically: page-level PageSpeed Insights/Lighthouse outputs for Moral Trade, WAVE page scans, `robots.txt`, `sitemap.xml`, structured-data test results, security-header scan results, and a full automated broken-link crawl. Google documents confirm that PSI combines lab and field data and that Core Web Vitals are measured from real-world loading, interactivity, and stability; WAVE also emphasizes that automated tooling supports but does not replace human evaluation. Those standards are cited here for context, but the corresponding Moral Trade outputs were not accessible in this environment. ⁸

The requested page coverage is summarized below.

Requested area	Public equivalent found	Audit status
Homepage	<code>/</code>	Reviewed. ⁹
About	<code>/about</code>	Reviewed. ¹⁰
How it Works	<code>/how-it-works</code>	Reviewed. ¹¹
Projects	No top-level “Projects” page found; closest equivalents are Worked examples , Public Goods Fund , candidate pools , and wish registry . ¹²	Missing as a conventional page
Donate	<code>/donate</code>	Reviewed. ¹³
Contact	<code>/contact</code>	Reviewed. ¹⁴
Blog/news	No conventional blog/news hub found in primary navigation; closest equivalent is Pilot Updates at <code>/updates</code> , which functions as a subscription/update landing page rather than a visible article archive. ¹⁵	Partially missing

The current public information architecture, as exposed in navigation, is broad and fairly deep for an early-stage site.

This map is taken directly from the site’s top-level navigation and repeated footer navigation across multiple pages. ¹⁶

Audit Findings

The site’s messaging is principled and serious, but often too dense for first-time visitors. The homepage headline and subheadline communicate the central idea well enough—clear, voluntary deals across moral disagreement with written terms, evidence rules, and manual review—but the surrounding language quickly becomes technical. Homepage sections such as “baseline confidence,” “externality review,” and “proof artifact,” together with the methodology page’s explanations of rule-based matching, wish profiling, portability, and distributed coordination, push the experience toward internal-spec language rather than public onboarding language. The result is a brand that feels thoughtful but relatively hard to enter. ¹⁷

The information architecture has a sensible organizing idea—**route by intent before exposing deeper mechanics**—and the homepage explicitly offers four initial paths: learn, test an example, donate through a route, or join/build. That is a good pattern. The problem is volume. The global navigation includes multiple conceptual layers before visitors even know whether they want to read, donate, join, or assess credibility. There is also no conventional top-level **Projects** destination, even though the site clearly contains project-like surfaces through worked examples, candidate pools, and public-goods pages. That gap matters because many nonprofit visitors look first for “What are you actually doing?” rather than “What is your theory of coordination?” ¹²

Brand consistency is strong. The site repeats the same institutional positioning—“a pilot institution for cooperation under disagreement”—across pages, and the same navigation taxonomy recurs consistently. That consistency helps serious readers orient themselves. However, it also makes almost every page feel structurally similar and text-heavy. The visual impression from the fetched content is closer to a policy/research product than a movement site, public-interest nonprofit, or donation platform. For a site that needs trust and participation, that can suppress emotional momentum. ¹⁸

The site appears to have some good accessibility foundations. Multiple pages expose a “**Skip to main content**” link, headings are visibly hierarchical, pages generally use one H1 with subordinate H2-like sections, and the content is largely linear and text-first, which often helps readability. WCAG 2.1 specifically adds criteria for mobile accessibility, low vision, and cognitive/learning needs; text-heavy pages with clear structure can be an advantage if the semantics are implemented correctly. That said, the inability to run WAVE or Lighthouse means color contrast, form labels, focus order, ARIA usage, and mobile tap-target quality were not accessible in this audit. One likely concern is cognitive load: many pages contain long link clusters and dense conceptual labels, which can be understandable to experts but taxing for mainstream users. ¹⁹

SEO readiness is mixed. On the positive side, public pages have distinct titles such as **How It Works | Moral Trade**, **About | Moral Trade**, **Donate | Moral Trade**, **Pilot Updates | Moral Trade**, and **What Is Moral Trade? | Moral Trade**; key pages are indexed in search results; and the site uses descriptive headings and topic-specific content. On the negative side, `robots.txt`, sitemap discovery, structured-data output,

canonical tags, and meta descriptions were not accessible, so this audit cannot confirm whether the technical fundamentals Google recommends are fully in place. Google's own documentation says `robots.txt` belongs at the site root, and structured data helps Google better understand organizations and page content. At minimum, Organization and Breadcrumb markup are obvious future wins for Moral Trade once implemented and validated. ²⁰

Performance and Core Web Vitals are the least certain area because PageSpeed/Lighthouse outputs were not accessible. Still, there are two useful observations. First, the public pages are predominantly text, with relatively little heavy media visible in the fetched output, which is favorable for payload size. Second, nearly every fetched page begins with a loading state—"Loading Moral Trade. Opening the requested workflow."—which strongly suggests an app-like shell, client-side transitions, or hydration work. That kind of architecture can hurt Largest Contentful Paint and interactivity if not carefully optimized, especially on slower mobile connections. Google documents define Core Web Vitals around loading, responsiveness, and visual stability, and recommend achieving good thresholds for user experience and search. Moral Trade should measure these directly rather than assume the text-first design is enough. ²¹

Security posture is partially visible and partially opaque. The site is served over HTTPS on the reviewed pages, and the privacy policy explicitly names **Supabase** for authentication/database storage, **Stripe** for payment workflows when enabled, **Every.org** for direct donation routes, and an external email provider for queued notifications. That is helpful disclosure. What is not accessible is the actual response-header posture: HSTS, CSP, Referrer-Policy, X-Content-Type-Options, and related headers could not be validated. OWASP recommends security headers because they help reduce preventable classes of web vulnerability. Moral Trade should therefore assume this remains an open task until verified. ²²

Analytics and attribution are better documented than on many early-stage sites. The privacy policy states that Moral Trade **may record lightweight product events** such as page views, worked-example opens, cohort interest, donation-route clicks, onboarding steps, and invite actions; it also says UTM parameters, referral codes, first path, last path, and referrer may be stored in a short-lived attribution cookie and copied into funnel records. That is a credible starting point and is unusually aligned with the product's privacy-first brand. The missing piece is visible measurement maturity: there is no public evidence of funnel reporting, experiment cadence, or published learning loops yet. ²³

The donation and conversion funnel needs the most redesign. The current flow is: arrive on the homepage, choose a path, land on the Donate page, choose a verified Every.org destination, donate off-site, and then optionally come back to log the gift so it can appear inside Moral Trade workflows. Separately, the Public Goods Fund asks users to pay externally, submit evidence, and wait for review before counting, while integrated checkout is only planned. This is a reasonable governance architecture for a prototype, but it is weak conversion architecture because it divides the moment of intent across multiple systems and asks users to understand internal bookkeeping concepts before they have fully bought into the mission. ²⁴

Trust signals are unusually explicit but still too thin. On the strong side, the site has visible sources, safety policy, anti-threat framing, validation rules, pilot status, and privacy detail; it even publishes unflattering but honest numbers like **0 live proposals** and **0 completed agreements**. On the weak side, the About page says governance is still forming, named reviewer/advisor roles should become public later, and the People page is a member directory with only two public profiles and no reviewed public record yet. The Contact page offers a generic support email and routing advice, but no named operator, leadership page, mailing

address, response commitments, or external endorsements. For a site asking people to trust both philosophy and process, that gap is material. ²⁵

The **blog/news** function is underdeveloped. The closest public equivalent, **Pilot Updates**, is a subscription landing page explaining what future updates will cover, but it does not expose a visible archive of posts or reports on the page itself. That makes the site look quieter and less alive than it may actually be. A functioning public updates archive is especially important here because pilot-stage trust depends on visible iteration, transparency reports, and published lessons more than on polish. ²⁶

A concise qualitative score snapshot is below. This is a synthesis from the audited pages, not an external benchmark.

Dimension	Score / 10	Confidence	Rationale
Content clarity	5	High	Serious and candid, but still too concept-dense for mainstream visitors. ²⁷
Information architecture	6	High	Intent routing is good, but nav depth is heavy and “Projects” is missing as a standard destination. ²⁸
Trust and transparency	7	High	Strong boundaries, safety, sources, and pilot-status honesty. ²⁹
Social proof and external credibility	4	High	Few public profiles, no completed agreements, limited named leadership. ³⁰
Donation/conversion UX	4	High	External handoff plus post-donation logging creates friction. ⁴
Accessibility readiness	5	Medium	Good structural signs, but no page-level WAVE/ Lighthouse validation was accessible. ³¹
SEO readiness	4	Medium	Distinct titles and indexing are present; robots/ sitemap/structured data output not accessible. ³²
Performance observability	3	Low	Likely app-shell loading state, but no PSI/ Lighthouse report was accessible. ³³

The current funnel, as experienced publicly, looks like this:

That funnel is directly implied by the homepage routing, donation page steps, and cohort page calls to action. ³⁴

Prioritized Recommendations

The table below focuses on specific improvements that are both actionable and high-leverage.

Priority	Recommendation	Effort	Why this matters	Suggested implementation steps
High	Rewrite the homepage around a plain-English problem → solution → first action story	Medium	The current homepage is honest but still concept-heavy for cold traffic. ²⁷	Keep the integrity language, but move it below the fold. Above the fold, explain in one sentence: what Moral Trade is, who it is for, and what to do first. Show exactly one primary CTA and two secondary CTAs.
High	Add a dedicated Projects hub	Medium	No conventional Projects page was found, even though users can browse examples, pools, and previews. ³⁵	Create <code>/projects</code> with three cards: Worked Examples, Public Goods Fund, and In Pilot / Upcoming. Use simple labels, visible status tags, and one-line summaries.
High	Publish named operators, advisors, reviewers, and governance owners	Low to Medium	About explicitly says those roles should become public later; right now team trust is thin. ³⁶	Add a real team/governance page with names, roles, short bios, links, conflict-of-interest statement, and what each person does or does not approve.

Priority	Recommendation	Effort	Why this matters	Suggested implementation steps
High	Redesign the donation funnel so users understand the off-site handoff immediately	Medium	Donation currently requires Every.org handoff and optional post-donation logging, which is high friction. ⁴	Add a 3-step progress strip, “You’ll complete payment on Every.org,” and a one-click post-donation confirmation page. Remove jargon like “Priority Correction Fund” from the first donation experience.
High	Add immediate trust strip messaging to homepage and donate pages	Low	The site has excellent trust material, but most of it is buried on secondary pages. ³⁷	Add a compact band under the hero: “Pilot stage,” “No custody or escrow,” “Manual review before reliance,” “Privacy-first matching,” “0 completed agreements—transparency first.”
High	Turn Pilot Updates into a true news/transparency archive	Medium	^{/updates} currently functions like a subscription landing page, not a visible content hub. ²⁶	Add update cards, dates, tags, archive pages, and three content types: pilot logs, governance updates, and case studies. Publish even short monthly changelogs.
Medium	Reduce jargon sitewide and introduce terms progressively	Medium	Terms like “baseline confidence” and “moral public goods” are meaningful but cognitively expensive. ³⁸	Add short definitions in tooltips or expandable help. Replace some phrases with simpler equivalents in top-layer copy; keep technical labels only on specialist pages.
Medium	Convert the People directory into two separate surfaces: team/governance and member directory	Medium	The current People page is not a substitute for visible leadership. ³⁹	Keep the public member directory, but add separate pages for “Team,” “Advisors,” and “Review governance.”

Priority	Recommendation	Effort	Why this matters	Suggested implementation steps
Medium	Implement technical SEO basics and validate them	Medium	Robots, sitemap, and structured-data outputs were not accessible; Google recommends these foundations. ⁴⁰	Ensure <code>robots.txt</code> and XML sitemap exist at root, connect Search Console, add Organization and Breadcrumb structured data, generate canonical tags, and validate indexing coverage.
Medium	Instrument Core Web Vitals and funnel analytics	Medium	Privacy policy already contemplates lightweight product events, but observable measurement maturity is not visible. ⁴¹	Add privacy-respecting analytics, field CWV monitoring, UTM plumbing, and dashboards for path completion. Track page-group outcomes, not vanity pageviews alone.
Medium	Run a WCAG 2.1 AA remediation pass	Medium	Structural signs are decent, but page-level accessibility diagnostics were not accessible here. ⁴²	Test templates with keyboard-only navigation, form labels, focus visibility, color contrast, heading landmarks, and screen-reader output. Prioritize homepage, donate, account creation, and contact flows first.
Medium	Harden security headers and publish a short security statement	Low to Medium	Security-header verification was not accessible; OWASP recommends these headers. ⁴³	Add CSP, HSTS, Referrer-Policy, Permissions-Policy, <code>X-Content-Type-Options</code> , secure cookie flags, and publish a short public security/privacy controls page.
Low	Add richer social proof once available	Low	Today the site has thin public validation, but should not fabricate it. ⁴⁴	When real data exists, add testimonials, pilot case studies, and “what we learned” updates rather than generic endorsements.

Priority	Recommendation	Effort	Why this matters	Suggested implementation steps
Low	Simplify or hide advanced mechanisms until activated	Medium	Pages like Priority Correction Fund are detailed but inactive, which can dilute clarity. ⁴⁵	Move inactive advanced mechanisms into “Research / Experimental” until there is live data, or clearly badge them as “Design concept, not active workflow.”

The copy below is where I would start.

Surface	Current direction	Recommended sample rewrite
Homepage hero	Mission is clear but abstract. ⁹	Headline: <i>Cooperate across deep value differences.</i> Subheadline: <i>Moral Trade helps serious participants test one small, reviewable commitment—like a pledge swap, donation offset, or public-good contribution—without pretending this is already a mature marketplace.</i> Primary CTA: <i>See a worked example</i> Secondary CTA: <i>Join the founding cohort</i>
Homepage trust strip	Trust information exists, but mostly below the fold. ⁴⁶	<i>Pilot stage. No custody or escrow. Manual review before reliance. Privacy-first matching. Transparent progress: 0 live proposals, 0 completed agreements.</i>
How It Works intro	Good process logic, but still internal-language heavy. ¹¹	<i>Start with one low-risk example. Write what would happen without the trade. Agree on proof. Review risks. Then decide whether to continue.</i>
Donate page intro	Accurate, but the extra “log it afterward” step is too early. ¹³	<i>Donate through a vetted route in three steps: choose a cause, complete payment securely on Every.org, and optionally return to record the gift for Moral Trade workflows.</i>
About page	Strong honesty, limited human accountability. ¹⁰	<i>What exists today, what does not exist yet, who runs the pilot, and what we will publish next.</i>
Contact page	Functional but generic. ¹⁴	<i>Need help? Choose the path that matches your issue: safety concern, review question, cohort/partner inquiry, or media/general contact. We read every message; urgent safety concerns go first.</i>

Recommended CTA set:

- **See a worked example**
- **Start with one low-risk action**
- **Donate through a vetted route**

- Read what exists today
- Meet the operators
- Follow pilot updates

These CTA formulations are closer to the site's real pilot posture than generic "Join now" or "Change the world today" language, and that alignment matters for trust. ⁴⁷

Because the privacy policy already outlines a lightweight event philosophy, the analytics plan should extend rather than replace that baseline. Recommended events are below.

Event	Trigger	Why track it
<code>hero_cta_click</code>	Click on primary/secondary hero CTA	Identify which first path actually converts
<code>first_path_selected</code>	Learn / Example / Donate / Join	Match acquisition source to intent
<code>worked_example_open</code>	Example detail page viewed	Measure educational engagement
<code>trust_page_open</code>	Trust / Safety / Validation pages	Understand whether trust content reassures or scares users off
<code>donation_route_click</code>	Every.org outbound click	Core donation intent metric
<code>donation_return_confirmed</code>	User returns from Every.org flow or confirms donation	Measure handoff loss
<code>cohort_join_start</code>	Click to join cohort / create account	Top-of-funnel participation
<code>cohort_join_complete</code>	Account created / first action submitted	True activation
<code>invite_started</code>	"Invite one serious counterparty" interaction	Key network-growth mechanism
<code>contact_route_selected</code>	Safety / review / partner / general	Helps staffing and UX prioritization
<code>update_subscribe</code>	Email update signup	Best proxy for slow-burn trust interest
<code>scroll_depth_75</code> on key pages	Deep scroll on homepage, donate, how-it-works	Check whether page length is helping or hurting

Those event recommendations fit the product-event categories already described in the privacy policy. ²³

The best first A/B tests are the ones that answer strategic questions, not cosmetic ones.

Test	Version A	Version B	Primary KPI
Hero framing	"Make clear, voluntary deals..."	"Cooperate across deep value differences..."	CTA click-through
Primary CTA	"Join the pilot"	"See a worked example"	Activated users / donations
Trust placement	Trust info below fold	Trust strip directly under hero	Scroll depth + CTA click
Donate page framing	Current "log afterward" wording	Simpler 3-step external-handoff explanation	Outbound donation click + return confirmation
Updates page	Email signup only	Visible archive + signup	Update subscriptions + return visits
Team credibility	Current About page	About page plus named operators/advisors	Contact submissions + signup conversion

Competitor Benchmarking

There is no perfect like-for-like comparator for Moral Trade. The most useful benchmarks are adjacent organizations that also need to combine trust, values, giving decisions, and public credibility. On that basis, the strongest comparison set is **Giving What We Can**, **Giving Multiplier**, **Every.org**, **Kiva**, and **GlobalGiving**. ⁴⁸

Benchmark site	What it does especially well	Evidence from the site	What Moral Trade should borrow
Giving What We Can	Clear value proposition, huge credibility surface, visible team/ transparency/member metrics, real blog, real sitemap	"Turn your income into outcomes," 10,000+ active pledgers, >\$490M donated by community, team page, transparency page, blog archive, sitemap. ⁴⁹	Publish visible team/ governance, community metrics, press signals, and a real content hub.
Giving Multiplier	Excellent explanation of a subtle moral dilemma, guided multi-step donation flow, secure/ trust cues, impact stats, testimonials	It explicitly explains the "heart vs. head" problem, shows step-based donation UI, publishes impact totals, and reassures users about privacy/ security and fee handling. ⁵⁰	Explain Moral Trade's subtle concept with a guided "how this works" funnel rather than policy language alone.

Benchmark site	What it does especially well	Evidence from the site	What Moral Trade should borrow
Every.org	Frictionless donation infrastructure, verified charities, multiple payment methods, nonprofit trust framing, platform clarity	It presents itself as easier giving for donors and nonprofits, supports cash/stock/crypto/mobile wallet/DAF, and publishes mission, nonprofit status, pricing, and API surfaces. ⁵¹	Keep using Every.org where useful, but make the handoff feel deliberate, trustworthy, and low-friction.
Kiva	Memorable headline, project categories, impact proof, recognition badges, clear risk disclosure, full-site discoverability	Kiva combines a clear CTA, categories, impact stats, charity ratings, blog/contact/site map, and explicit lending-risk disclosure. ⁵²	Pair idealism with strong, plain-language risk disclosure and visible impact proof.
GlobalGiving	Project-based browsing, vetted grassroots credibility, donor updates, visible brand resources	Official pages emphasize vetted locally driven organizations, donor safety/ease, and regular impact updates; a brand-assets page is also public. ⁵³	Build a real “projects and updates” hub so the site feels active, evidence-based, and externally legible.

The benchmark pattern is very clear. Moral Trade already outperforms many peers on philosophical honesty and procedural boundaries. It underperforms them on the conventional trust and conversion signals that ordinary visitors look for first: simple value proposition, named team, impact evidence, content freshness, recognizable “projects,” and a smoother action path. ⁵⁴

Roadmap

A practical roadmap for the next year is below. The emphasis is sequencing: fix meaning first, then trust presentation, then technical measurement, then deeper product flow.

The milestones below are the ones I would hold the team accountable to.

Time window	Milestone	Success condition
Month one to two	homepage rewrite, trust strip, named operators, Projects hub stub, real updates archive	A new visitor can answer: what it is, what is live, who runs it, and what to do first within 15 seconds
Month two to four	donation-flow simplification, analytics instrumentation, Search Console, sitemap/robots/schema basics	You can see channel-by-channel funnel data and detect donation drop-off points
Month four to six	WCAG remediation, CWV measurement, header hardening, first A/B test cycle	Accessibility issues and performance bottlenecks are being measured and fixed in a repeatable way
Month six to twelve	transparency reports, live pilot case studies, mature team/governance page, improved project pages	The site has moved from “interesting theory pilot” to “credible operating institution with visible learning”

A final strategic point: the next phase should not be “add more mechanisms.” It should be “make the existing mechanism legible, trustworthy, and measurable.” The site already has enough conceptual sophistication to impress the right reader. What it lacks is enough public simplicity to convert the next reader. ⁵⁵

Overall confidence in this report is **high** for messaging, IA, trust signals, and conversion-funnel findings; **moderate** for accessibility and SEO recommendations; and **lower** for performance and security specifics because the requested PageSpeed, WAVE, robots/sitemap, security-header, and full crawl outputs were **not accessible** in this audit environment. ⁵⁶
